

Widening the requested period range 20× costs 1.3–1.4×.

Figure 2. (A) Computational cost of extending BWTandem's maximum period from 100 bp to 2,000 bp on GRCh38 across 3 replicates, all run at commit 07ad6fa, where the maximum-period argument filtered the report without bounding the Tier 3 search; a re-measurement at the release build 0363d8b, where it bounds the search as well, is in progress. (B) Runtime scaling of ULTRA and TRF on maize Mo17 as the maximum period increases (log-log scale). (C) Total computational resources (core-hours and peak memory) for human whole-genome processing. Points are labeled by their period cap; these runs are not range-matched, and the competitor FASTA carries 3.92% more sequence.
